if i want to clone my own git project to my local drive, which one:

```
git clone https://github.com/mbloflin/Alarming.git  
gh repo clone mbloflin/Alarming
```

Both commands will clone your Git project to your local drive, but they are used in slightly different contexts:

1. `git clone https://github.com/mbloflin/Alarming.git` - This command uses the standard Git syntax to clone the repository from GitHub to your local machine. You just need Git installed on your system to use this command.
2. `gh repo clone mbloflin/Alarming` - This command uses the GitHub CLI tool ( `gh` ) to clone the repository. You'll need to have the GitHub CLI installed and possibly authenticated to your GitHub account to use this command.

Choose based on whether you have GitHub CLI installed and prefer using it, or if you're sticking to the standard Git commands.

but either way I will end up with the same, a clone that i can further develop and push back to git later

Yes, exactly! Both commands will give you a local copy of the repository that you can develop further. You can make changes, commit them, and push them back to the remote repository on GitHub using either p. The choice between using `git` or `gh` mostly depends on your preference and whether you have the GitHub CLI set up.
